# Visual representation for Insertion in array on nth position

Initial Array

X i.e., 10 approaches to 5th position Pos = 5

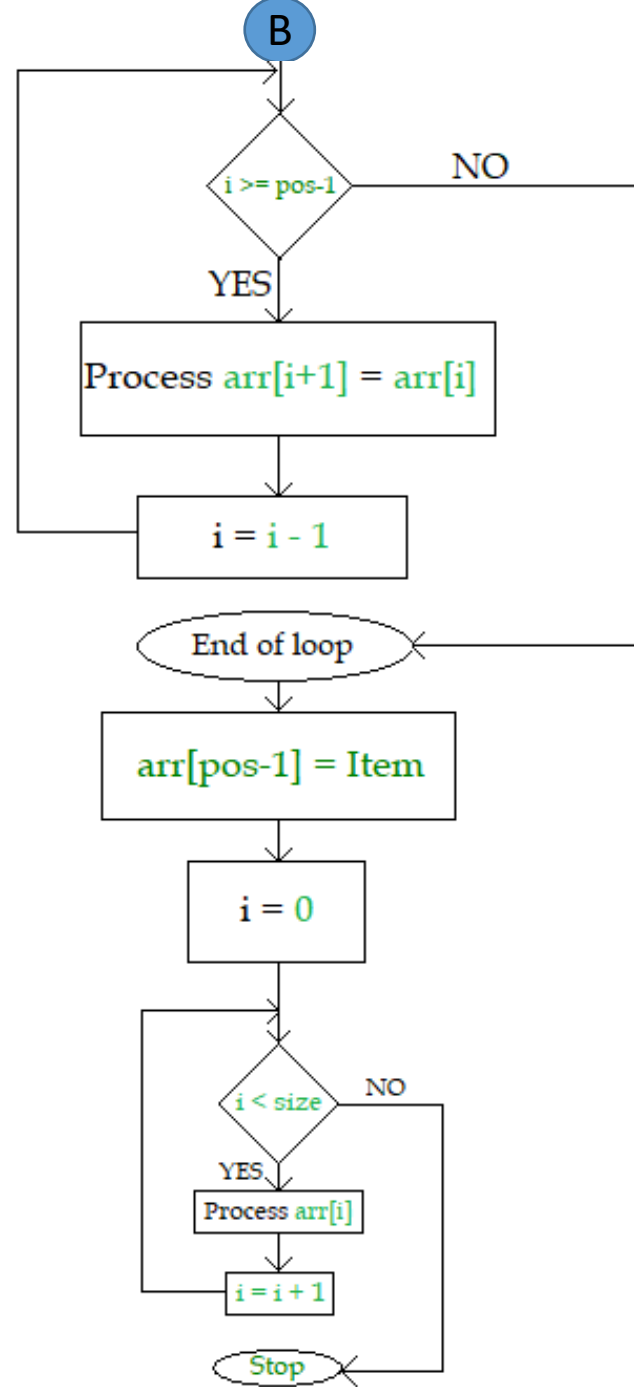

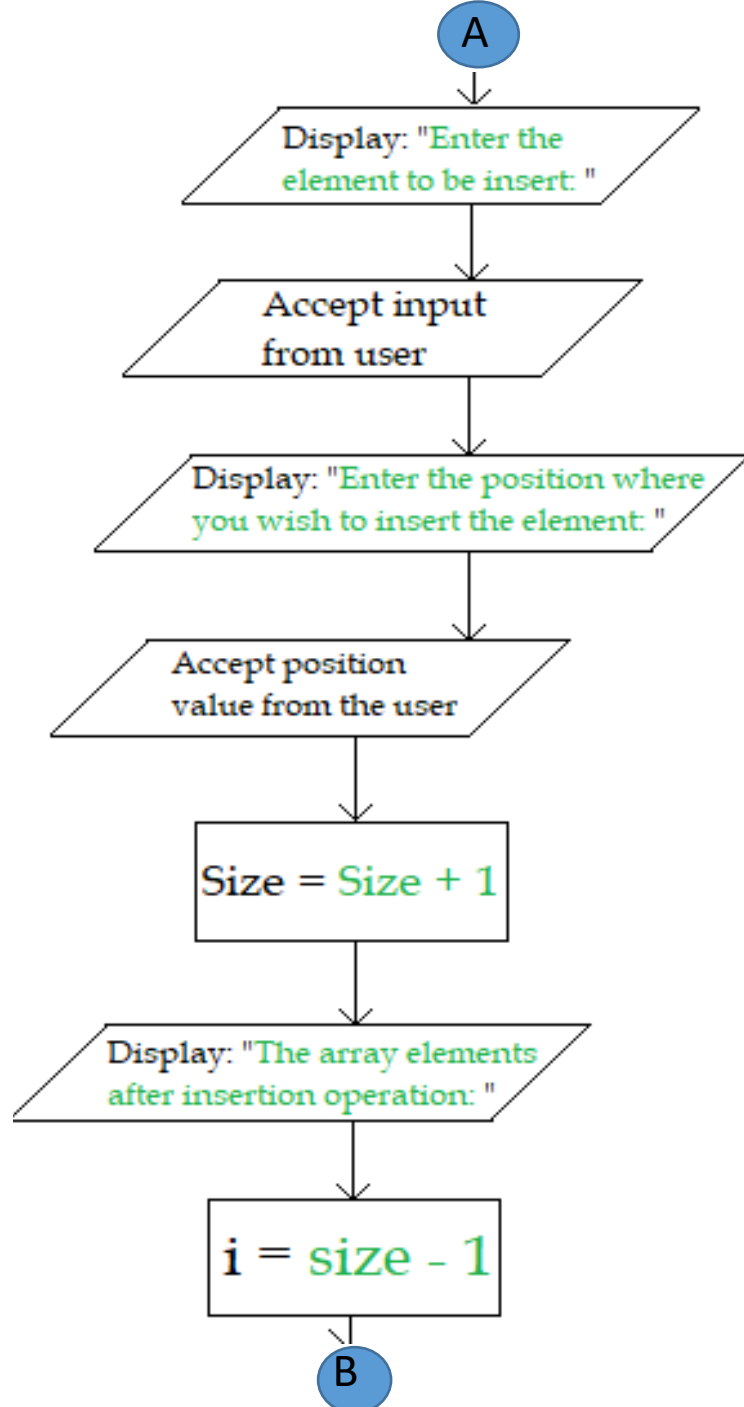

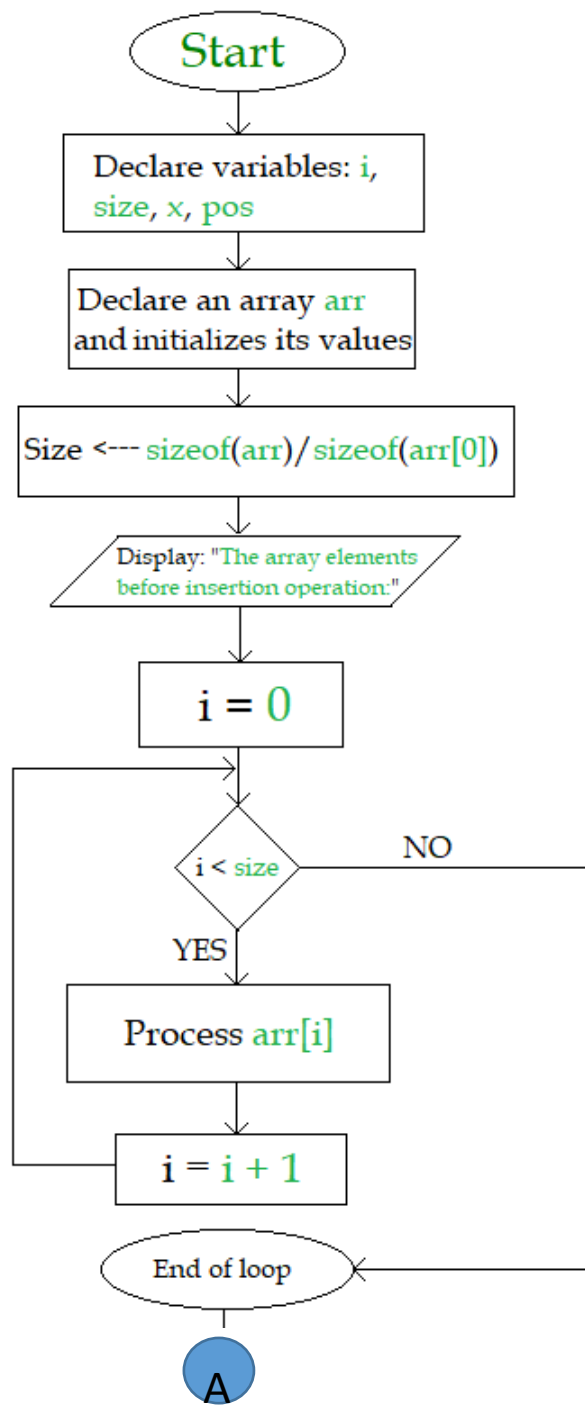

Increasing the size of the array by one (1)

12 shifted to one position forward

Array with X inserted at position pos

## Variables we are using here:

**arr** : Name of the array.

**size** : Size of the array (i.e., total number of elements in the array)

**i** : Loop counter or counter variable for the for loop.

**x** : The data element to be insert.

**pos** : The position where we wish to insert the element

# Insert into an Array: Algorithm

**Insert(arr[], pos,x)**

**Step 01:** Begin

**Step 02:** [Reset size of the array. ]

set size = size + 1

**Step 03:** [Initialize counter variable. ]

Set i = size - 1

**Step 04:**

Repeat Step 05 and 06 for i = size - 1 to i >= pos - 1

**Step 05:** [Move  $i^{\text{th}}$  element forward. ]

set arr[i+1] = arr[i]

**Step 06:** [Decrease counter. ]

Set i = i - 1

**Step 07:** [Insert element. ]

Set arr[pos-1] = x

**Step 09:** End

# Algorithm for Append an element in the array

## Variables we are using here:

**arr** : Name of the array.

**size** : Size of the array (i.e., total number of elements in the array)

**i** : Loop counter or counter variable for the for loop.

**x** : The data element to be insert.

## Append (arr[], x)

**Step 01:** Begin

**Step 02:** [Reset size of the array. ]

set size = size + 1

//Increase the array size by 1 to append

**Step 03:** [Insert element. ]

Set arr[size] = x

**Step 04:** End

# Delete an element on nth position from Array

## Variables we are using here:

**arr** : Name of the array.

**size** : Size of the array (i.e., total number of elements in the array)

**i** : Loop counter or counter variable for the for loop.

**pos** : The position where we wish to insert the element

## Delete(arr[], pos)

**Step 01:** Begin

**Step 02:** [Initialize counter variable. ]

Set  $i = pos$

**Step 03:**

Repeat Step 04 and 05 for  $i = pos+1$  to  $i < size$

**Step 04:** [Move  $i^{th}$  element backward ]

set  $arr[i] = arr[i+1]$

**Step 05:** [Increase counter. ]

Set  $i = i + 1$

**Step 06:** [Reset size of the array. ]

set  $size = size - 1$

// Decrease the array size by 1 as deleted the element

**Step 07:** End

# Traverse the array

## Variables we are using here:

**arr** : Name of the array.

**size** : Size of the array (i.e., total number of elements in the array)

**i** : Loop counter or counter variable for the for loop.

## Traverse(arr[])

**Step 01:** Begin

**Step 02:** [Initialize counter variable. ]

Set  $i = 1$

**Step 03:**

Repeat Step 04 and 05 for  $i = 1$  to  $i \leq \text{size}$

**Step 04:** [Move  $i^{\text{th}}$  element backward ]

display arr[i]

**Step 05:** [Increase counter. ]

Set  $i = i + 1$

**Step 07:** End

# Numeric array

- Write Algorithm to delete the element
- Write Algorithm to update the element
- Write algorithm to reverse the element
